

CLAIMS

What is claimed is:

- 5 1. A disk controller for implementing efficient disk I/O for a computer system, comprising:
- a bus interface for interfacing with a processor and a system memory of the computer system;
- a disk I/O engine coupled to the bus interface; and
- 10 a device interface coupled to the disk I/O engine for interfacing the disk I/O engine with a disk drive, wherein the disk I/O engine is configured to cause a start up of the disk drive upon receiving a disk start up command from the processor, the disk I/O engine further configured to execute a disk transaction by processing the disk transaction information from a bypass
- 15 register coupled to the disk I/O engine.
2. The disk controller of claim 1, wherein the bus interface is configured to interface with the processor and the system memory of the computer system in accordance with a hyper transport protocol.
- 20 3. The disk controller of claim 1, wherein the device interface is configured to coupled to a serial ATA interface of the disk drive.
4. The disk controller of claim 1, wherein the device interface is
- 25 configured to couple to an IDE interface of the disk drive.

5. The disk controller of claim 1, further comprising:

a completion status register coupled to the disk I/O engine configured to notify the disk I/O engine and indicate a completion of a pending disk I/O command.

5

6. The disk controller of claim 1, further comprising:

a CPB pointer buffer coupled to the disk I/O engine for dynamically appending a plurality of CPB pointers to extend to a number of disk transactions scheduled for execution by the disk I/O engine.

10

7. The disk controller of claim 1, further comprising:

a chain memory coupled to the disk I/O engine for buffering a plurality of CPBs to extend to a number of disk transactions scheduled for execution by the disk I/O engine.

15

8. A bridge component for implementing efficient disk I/O for a computer system, comprising:

a bus interface for interfacing with a processor and a system memory of the computer system;

20 a disk controller for executing disk I/O transactions for the computer system, the disk controller further comprising:

a disk I/O engine coupled to the bus interface; and

25 a device interface coupled to the disk I/O engine for interfacing the disk I/O engine with a disk drive, wherein the disk I/O engine is configured to cause a start up of the disk drive upon receiving a disk start up command from the processor, the disk I/O engine further configured to execute a disk

transaction by processing the disk transaction information from a bypass register coupled to the disk I/O engine.

5 9. The bridge component of claim 8, wherein the bridge component includes a plurality of disk controllers for implementing a plurality of channels for a corresponding plurality of disk drives.

10 10. The bridge component of claim 9, wherein at least one of the channels is a serial ATA channel.

11. The disk controller of claim 8, further comprising:
a completion status register coupled to the disk I/O engine configured to notify the disk I/O engine and indicate a completion of a pending disk I/O command.

15 12. The disk controller of claim 8, further comprising:
a CPB pointer buffer coupled to the disk I/O engine for dynamically appending a plurality of CPB pointers to extend to a number of disk transactions scheduled for execution by the disk I/O engine.

20 13. The disk controller of claim 8, further comprising:
a chain memory coupled to the disk I/O engine for buffering a plurality of CPBs to extend to a number of disk transactions scheduled for execution by the disk I/O engine.

25 14. A computer system configured to implement efficient disk I/O, comprising:

a processor;
a system memory coupled to the processor;
a bridge component coupled to the processor; and
a disk controller coupled to the bridge component, the disk controller

5 including a plurality of bypass registers, wherein the processor executes software code stored in the system memory, the software code causing the computer system to implement a method comprising:

transferring a command from the processor to the disk controller,
the command causing a start up of a disk drive coupled to the disk
10 controller;

preparing disk transaction information by packaging a plurality
of data structures comprising the disk transaction;

transferring the disk transaction information to the bypass
registers of the disk controller;

15 implementing a disk I/O, wherein the disk controller processes the disk transaction information to control the disk drive.

15. The computer system of claim 14, wherein the bridge component
includes a plurality of disk controllers for implementing a plurality of
20 channels for a corresponding plurality of disk drives.

16. The computer system of claim 15, wherein at least one of the
channels is a serial ATA channel.

25 17. The computer system of claim 16, further comprising:

a completion status register coupled to the disk I/O engine configured to notify the disk I/O engine and indicate a completion of a pending disk I/O command.

5 18. The computer system of claim 17, further comprising:

a CPB pointer buffer coupled to the disk I/O engine for dynamically appending a plurality of CPB pointers to extend to a number of disk transactions scheduled for execution by the disk I/O engine.

10 19. The computer system of claim 18, further comprising:

a chain memory coupled to the disk I/O engine for buffering a plurality of CPBs to extend to a number of disk transactions scheduled for execution by the disk I/O engine.

15 20. The computer system of claim 19, wherein the bridge component is a Southbridge component.
